U. S. NAVAL AVIATION SAFETY CENTER
U. S. NAVAL AIR STATION
NORFOLK, VIRGINIA 23511

NASC/dy Ser 112/1785 17 November 1965

SPECIAL HANDLING REQUIRED IAW OPNAVINST 3750.6 SERIES

From: Commander, U. S. Naval Aviation Safety Center

To: Commanding Officer, U. S. Naval Air Test Facility (Ship

Installations), U. S. Naval Air Station, Lakehurst, New Jersey

Subj: NAVAIRTESTFAC(SI) LAKEHURST AAR ser 1-65A concerning NA-4B BuNo 142685 accident occurring 31 August 1965, pilot (b)

- The subject report and all endorsements thereon have been reviewed.
 The Naval Aviation Safety Center concurs with the comments and recommendations of the Aircraft Accident Board as modified by subsequent endorsers.
- 2. The cause of this accident has been recorded by the Center indicating the PILOT (incomplete pre-flight inspection) as the single cause factor.

(b)(6)

By direction

Copy to: BUVEPS (ESA) (2) COMNAVARTESTORS CO NAS LAKEHURST BUWEPSREP LONG BEACH

.

NWSA FSA-3:WHH 4 November 1965

SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST P3750.6E

FOURTH ENDORSEMENT on NATF(SI), serial 1-65, concerning NAAB BUNO 142685, accident occurring 31 August 1965, pilot (b) (6)

From: Chief, Bureau of Naval Weapons

To: Commander, U. S. Naval Aviation Safety Center

Subj: Aircraft Accident

Ref: (a) NAVWEPS 01-40A0A-1 NATOPS Flight Manual A4A/B

- 1. Forwarded, concurring in the comments and recommendations of the Air-craft Accident Board and as modified by subsequent endorsements except as noted below.
- 2. The Bureau does not concur that a change to the NATOPS Manual is required. Section III, Part I, page 3-3, Item number 3 of reference (a) specifies the following "The briefing guide will include the following items, when applicable:
 - 3. Fuel load, stores and aircraft gross weight."

Compliance with the foregoing could have prevented this accident.

By direction

Copy to: NATC PAX RIVER CO, NAS LAKEHURST CO, NATF(SI)

ONISHIAL

NA4B FT2211-440 OCT 271965

THIRD ENDORSEMENT on NATF(SI), serial 1-65, concerning NA4B BuNo 142685, accident occurring 31 August 1965, Pilot (b) (6)

From: Commander, Naval Air Test Center

To: Commander, Naval Aviation Safety Center

Via: Chief, Bureau of Naval Weapons

Subj: NATF(SI) Aircraft Accident Report 1-65

1. Forwarded, concurring with the conclusions of the Board.

2. Pilots of this command are continually briefed regarding the necessity for thorough familiarization with an aircraft prior to conducting a test project. IT is qualified in the A4B in all respects and his professionalism in test work is highly regarded.

D. F. SMITH, JR.

SECOND ENDORSEMENT on NATF(SI), serial 1-65, concerning NA4B, BUNG 142685, accident occurring 31 August 1965, Pilot (b) (6

Commanding Officer, U. S. Naval Air Station, Lakehurst, N. J. Commander, Naval Aviation Safety Center, Norfolk, Virginia From: (1) Commanding Officer, U. S. Naval Air Test Center, Patuxent To: VIA:

River, Haryland

(2) Chief, Bureau of Naval Weapons

MATF(SI) Aircraft Accident Report 1-65

1. Forwarded.

- 2. The Naval Air Station, Lakehurst has the standard complement of crash and rescue vehicles, including a four-wheel drive, high chassis, forcible entry truck with an Ansul Chemical Firefighting Unit attached, which is capable of traversing most of the terrain, except wooded areas. Surrounding terrain at Lakehurst consists of a very loose sandy soil, areas heavily wooded with pine trees, and swampy areas also heavily wooded. The Army LARC Vehicle would not increase our capability, inasmuch as the swampy and wooded terrain require a bulldozer and prepared roadbed for access. To improve our crash firefighting capability, a single vehicle is needed which will penetrate 12-inch diameter trees within a marsh and be able to put out fires with its own attached equipment.
- 3. The ditch approximately 500 feet from the end of the runway will be graded and leveled so as not to be an additional hazard to aircraft.

Copy to: BUWEPS (Advance) MAYAVNSAFECEN (2) (Advance) BUWEPSREPLONGBEACH CO, NATF(S1) CO, NATC (Advance)

FIRST ENDORSEMENT on NATF(SI) AAR 1-65 dtd 31 Aug 1965 NA4B BUNO 142685 Pilot BULL

From: Commanding Officer, U. S. Naval Air Test Facility (Ship Installations)
U. S. Naval Air Station, Lakehurst, N. J.

To: Commander, Naval Aviation Safety Center, Norfolk, Virginia

VIA: (1) Commanding Officer, U. S. Naval Air Station, Lakehurst, N.J. (2) Commanding Officer, U. S. Naval Air Test Center, Patuxent

River, Maryland
(3) Chief, Bureau of Naval Weapons

Subj: U. S. Naval Air Test Facility (SI) Aircraft Accident Report 1-65 of 31 August 1965, NA4B BUNO 142685, Pilot (b) (6)

1. Forwarded.

- 2. I concur with the conclusions reached by the Aircraft Accident Board in that the accident was caused primarily by pilot complacency, predetermined thoughts, preoccupied thoughts or a combination thereof. Despite this apparent pilot error, it should be stated that LT be has repeatedly demonstrated high pilot proficiency at this Test Facility in a variety of aircraft. His excellent professionalism is known and recognized.
- 3. Comments on the Aircraft Accident Board s recommendations are as follows:
- a. It is concurred that <u>all</u> pilots must be constantly reminded of the importance of conducting conscientious and thorough pre-flight procedures. The tendency for competent pilots to become complacent must be continuously curbed. LT (b) was fortunate to emerge from this accident unscathed and will probably never relax his vigilance again. Other pilots cannot always count on luck to rescue them from situations caused by complacency.
- b. It is concurred that all pilots be mentally prepared for unusual emergency situations. In that LT(b) was apparently completely oblivious to the fact that his aircraft was very heavy, his failure to jettison the external stores is understood. However, it would seem that jettison action of any weight, however small, should be SOP for situations wherein the aircraft fails to lift off or climb and abort action is no longer possible.

- captain cannot be present during the pilot's inspection. The pilot should be made aware of this fact, as he was in this incident, and should exert extra vigilance during his pre-flight inspections.

 d. It is concurred that the NATOPS procedures for the A4 be modified to require visual inspections of external stores for present and the concurred that the
- d. It is concurred that the NATOPS procedures for the A4 be modified to require visual inspections of external stores for presence of liquids. This is the normal procedure in this Command. Cockpit placards will be used to indicate contents of external stores in the future.
- e. It is concurred that the Naval Air Station, Lakehurst, be provided with crash and rescue vehicles capable of penetrating the terrain of the station and surrounding area. This accident was fortunate in that no disabling injury occurred to the pilot or that no fire started at the aircraft. If such had not been the case, a tragedy could have been the result of non-availability of crash and rescue equipment capable of coping with existing terrain of the Air Station.
- f. It is concurred that the ditch located in the overrun area be filled. Such fill would not have prevented or reduced the damage of this accident, but could be of benefit in the event aircraft run off the runway in the future.
- 4. LT was involved in one previous accident. In 1960 he successfully ditched a F3H Demon when flameout occurred immediately after receiving a catapult shot. He was assessed Zero (0) pilot error. Enclosure (17) outlines the pilot's wide experience and is indicative of his versatility. His pilot ability at this activity has always been excellent.
- 5. All pilots of this Command have been reinstructed to exercise extra caution in conducting pre-flight inspections of the aircraft. They have also been reinstructed to become completely aware of aircraft limitations as concerns weight, take-off distance and take-off speed. As has been mentioned previously, cockpit placards will be used to indicate external loadings.

Part V - The Accident

LT (b) was scheduled for a 14% take-off from Lakehurst to deliver A4B, BuNo 142685 to NATC, Patuxent River for weight and balance. After filing his flight plan, and preflighting the aircraft, he taxied to the approach end of Runway #24, received take-off clearance, and commenced his take-off roll at 14%7 local.

Because of conditions discussed in the investigation and analysis portion, (Part VII) of this report, the aircraft was unable to get airborne in the 5,000 feet of useable runway. The aircraft continued beyond the upwind end of the runway in an estimated 20-25 degree nose high attitude for 504 feet where it struck the far side of a 27 foot wide ditch with all three landing gear.

At this point, the aircraft bounced into the air to an approximate altitude of 5 to 10 feet (confirmed by height of trees clipped off in its flight path) and rotated to an even higher nose up attitude. It maintained this altitude and nose high attitude for another 406 feet where it struck the top strand of a four foot barbed wire fence (see Enclosure 2 and 4).

The flight path remained virtually the same for the next 275 feet with numerous pine trees of a 2 - 4 inch diameter being clipped off 6 - 8 feet above ground level.

The aircraft then changed flight path approximately 40° starboard and continued for 450 feet without tree contact (see Enclosure 2). This is probably due to terrain with a slight down gradient. Impact with the ground was made 520 feet from the surfaced asphalt road. The aircraft then slid for 330 feet before coming to rest in a slightly nose down attitude.

LT (b) (6) opened the canopy, climbed out of the cockpit, and secured the engine while standing alongside the aircraft. He then made his way from the aircraft and was picked up an an HC-Twofhelo at 1415, (see Enclosures 1 - 11).

[&]quot;SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 375%.6E".

Part VI - Damage to Aircraft

The aircraft received relatively minor damage as it traveled the 1,705 feet from the end of the runway to the impact point. It suffered strike damage as it struck the ground and skidded the 330 feet to its final resting place.

Small fragments of metal, three drop tank tail cones, a damaged barbed wire fence and numerous broken bushes and small pine trees were found in the aircraft's flight path up to the final impact point. The impact with the ground collapsed the three landing gear rear-ward and demolished the remains of the three drop tanks. The collective forces of the impact and 330 feet skid demolished the fuselage nose section, the underside of the fuselage, the leading edge and underside of the wing.

The engine received FOD damage from leaves, branches and debris.

The engine and accessories will be shipped to O&R Quonset Point for final disposition. The airframe will remain on board NAS Lakehurst, N. J. (See Enclosures 12 - 16).

[&]quot;SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 375%.6E".

Part VII - Investigation and Analysis

The Safety Officer and Maintenance Officer were at the scene of the crash ten minutes after the mishap and the other members of AAR Board shortly thereafter. After ensuring that the pilot was uninjured, the accident investigation was commenced. From these findings, the Board considered the following facts worthy of discussion and analysis.

LT (b) (6) was anxious to get home because he had been TAD to NATF(SI) since 10 June 1965, spending only weekends at home. During this period, his wife gave birth to a premature child that was still hospitalized in an incubator at the time of the accident. However, since LT (b) (6) did not volunteer for the flight, but was requested to assist this command in delivering the aircraft, the Board does not feel that a classification of "get-homeitis" is necessarily warranted.

The fact that he had flown four different types of aircraft (F8, T2, T-28 and A4) in the preceeding twenty-four hours would, regardless of experience and training, tend to lessen his ability to rapidly and accurately diagnose the unusual situation in the short period of time he had in covering the last 1,500' of runway. This same fact, coupled with pilot's demonstrated proficiency and recent experience in the RDT&E effort, lends itself to a probable complacency factor.

LT was not informed that the aircraft had been previously loaded for a heavy weight CE 1-3 catapult launch and, therefore, had 6,500 lbs. of water in the external tanks.

The regular plane captain was not on hand to send the aircraft out and the pilot was not advised that the replacement was a qualified A4B plane captain prior to being transferred to powerplants in March 1965. The man was familiar with NATOPS procedures, however, and standard signals were used.

The pilot failed to ascertain the exact gross weight of the aircraft prior to take-off. The preconceived idea that the external tanks would be empty and that the plane captain would not be familiar with the aircraft are probably the most significant factors in:

- (1) Not noticing the aircraft loading marked on the yellow sheet.
- (2) Not questioning the plane captain as to loading or aircraft conditions after preflight.
 - (3) The typical thud of a fluid filled tank not registering.
- (4) Disregarding the feeling that the aircraft felt heavy while taxiing.
- (5) His failure to analyze the situation during take-off; i. e., the problem had nothing to do with excessive weight; therefore, the idea of jettisoning the tanks was not considered.

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 375%.6E".

Part VII - Investigation and Analysis cont.

valid in the light of his misconception of aircraft gross weight. It is standard procedure for this activity to use the 5,000 foot runway for take-off providing aircraft weight and density altitude indications ensure a safe operation. The actual ground roll (6,200 feet) and airspeed (156.5 knots) required for a 22,100 lb. take-off at a density altitude of plus 900 feet are depicted in Enclosures (19) and (20). These enclosures also verify the fact that had the pilot jettisoned the external tanks at the speed he obtained (almost 150 knots), he would have literally jumped into the air. Actual lift off airspeed for the aircraft without tanks was computed to be 123 knots.

The engine is being removed for transfer to an O&R Facility for salvage. No DIR request was made due to the lack of any factual evidence indicating an engine malfunction. The aircraft was returned from PAR on 6 May 1965 and since that time has flown 55 hours. The last eighteen sorties were accomplished without an aircraft discrepancy with the last thirty plus sorties being flown without an engine discrepancy. The last engine discrepancy, a guage malfunction, was reported on 2 August 1965. The engine indications reported by the pilot and the distance traveled during the mishap also verifies the opinion of the Board that the engine was developing maximum thrust.

ASC 135, cockpit indication of external fuel load, was incorporated in the aircraft. However, as previously stated, the external tanks are used only for water ballast and as such, the tank portion of the ASC was never incorporated because the system would soon be rendered useless due to corrosion.

In the opinion of the Board, there was no violation of NATOPS procedures. A change in procedures is indicated, however, in that, had the pilot visually checked the tanks, this accident would have been prevented. A recommended change in accordance with OPNAVINST 351%.9 is forthcoming.

Personnel taking part in the rescue and salvage operations are to be commended for a job well done.

An HC-2 Helo, on an instrument training hop, was over the scene of the crash within minutes. With the exception of the pilot getting in the sling backwards, no difficulty was experienced in the rescue.

Due to the location of the wreckage, i. e., dense brush, marsh land and distance from the nearest access road, it was impossible for crash equipment to get within 500 feet of the mishap. It was, therefore, anticipated that salvage operations would be a difficult and time consuming operation. There is in fact no question that the actual job of getting the aircraft out of the brush was difficult; however, the NAS Lakehurst salvage team completed the operation in minimum time. See Enclosures (17) and (20).

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 375%.6E".

Part VIII - Conclusions

The Aircraft Accident Board in its findings determined that the primary cause factors of this accident was pilot error in that he:

- (1) Failed to realize, either by preflight or other available information the actual gross weight of the aircraft prior to take-off.
- (2) Failed to analyze the situation rapidly enough to jettison the external stores, once committed to take-off.

It cannot be definitely stated whether these factors were an end result of pilot complacency, a case of predetermined and/or preoccupied thought, or any combination thereof. However, in the opinion of the Board, ALL THREE OF THE FOREGOING HUMAN ELEMENTS CONTRIBUTED IN SOME DEGREE to the pilot's actions and reactions.

A contributing cause of the accident was a supervisory factor in that:

(1) The qualified plane captain who preflighted the aircraft was not made available to send the aircraft out. Had he been present, rapport between LT (b) and himself may have established the actual fuel loading of the aircraft.

Part IX - Recommendations

It is recommended that:

- (1) All pilots be constantly reminded of the importance of conducting a conscientious and thorough preflight, i. e., flight planning (including take-off roll), read and study applicable portions of yellow sheet, and perform a thorough visual inspection of the aircraft, etc.
- (2) All pilots be continuously reminded of the necessity to mentally prepare themselves for unusual emergency situations.
- (3) The plane captain that is responsible for pre-flighting the aircraft be present during the pilot's preflight and call his attention to any external loading. Also, ensure that a cockpit indication is provided.
- (4) A change in NATOPS procedures to require the pilot, during preflight, to visually inspect the external stores for presence of liquids.
- (5) NAS Lakehurst be provided with crash and rescue vehicles (Army LAL), capable of penetrating the terrain surrounding the Air Station.
- (6) The ditch located in the overrun area of Runway 24 be filled in to provide a smooth surface.

PILOT STATEMENT of AIRCRAFT ACCIDENT, NA4B, BUNO 142685 OCCURRING 31 AUG. 1965

At about 1330 on 31 August 1965, I went out to the West Field NATF(SI) Line to man A-4B, BuNo 142685 for a ferry flight to NAS Patuxent River. The purpose was to take the aircraft to NATC for a current weight and balance. The aircraft was being used in SATS catapult testing and an accurate C. G. and weight were desired.

As this was only a ferry hop, I did not expect the external tanks to be filled with water. No one had mentioned to me that the external tanks would be filled, and normally the tanks are only filled at the Test Facility runway (about one mile away) for test purposes. Since the long 12,000 Test Facility runway was being worked on and was not manned with crash crew or tower personnel, I planned to take off from the 5,000 foot runway at West Field under the impression that the external tanks would be empty. Take-off performance of the A-4 has been one of the primary concerns of the SATS catapult testing that I have conducted for the past three months. I have first hand knowledge from personally flight testing and observing about one-hundred A-4 heavy weight take-offs and am extremely aware of A-4 take-off performance. I am very familiar with take-off distance and airspeed requirements for gross weight and density altitude. Take-offs on the 5,000 foot runway at West Field are normal operations at Lakehurst in an A-4 with empty tanks, and I did not anticipate any problem whatsoever. I read past yellow sheets and the aircraft was in good condition with very few maintenance gripes. I did not notice any indication of water in the external tanks and overlooked it if it was there.

I had been informed that the personnel sending me out might not be completely familiar with the A-4 as the NATF(SI) Line crew was being secured early for a picnic. Therefore, on my pre-flight I did not ask any questions of the plane captain as I did not expect him to be too acquainted with that particular aircraft.

During my pre-flight, I rapped the external tanks, but I must have had such a preconceived notion that they would be empty, that the typical thud of a full tank did not register in my mind. I found no discrepancies and manned the aircraft.

Start and post start procedures were normal and the aircraft was ready for flight in every way.

Under the impression that the external tanks were empty, I called for taxi to take-off from the 5,000 foot duty runway at West Field. After completing the take-off checklist and establishing half flaps with four units nose up trim, I called for and received take-off clearance.

I added full throttle, read 100% RPM, 660°EGT, and commenced take-off roll. I did not feel anything abnormal until the last 1,500 feet when I noticed

OPNAVINST 3750.6E

ORIGINAL

ENCLOSURE (2)

PILOT STATEMENT of AIRCRAFT ACCIDENT, NA4B, BUNO 142685 OCCURRING 31 AUG 1965 cont.

that the nose was not coming up the way it should. I then decided to keep the nose on the runway as long as possible to gain as much speed as I could. At the end of the runway, I rotated to a flying attitude with almost 150 KTAS but the aircraft did not become airborne. I then rotated further as the aircraft went onto the dirt overrun and became airborne simultaneously with a fairly hard jolt as if I had hit something. The airspeed immediately began to drop off and I made a quick attempt to raise the landing gear to reduce drag, but it was obvious I was settling back into the trees. I was airborne an extremely short time, and I was not completely aware yet that my problem was full external tanks rather than a power failure or some other malfunction. I had no chance to observe instruments in the cockpit as the aircraft was very close to stall, and I was trying to see where I was headed. I did not eject because I was holding back pressure on the stick and had I let go, the aircraft would have pitched over nose down into the trees. I pulled the throttle back attempting to shut the engine down about the time the aircraft first hit the trees, and I braced myself with head lowered. The impact was much less than I anticipated, and I was joited only slightly in the cockpit.

The aircraft came to a stop fairly well intact, and the cockpit area did not appear to have suffered much damage. I opened the canopy by the normal method, unstrapped, and climbed out of the cockpit. I then noticed the engine was still running at idle, so I reached back in and shut off the throttle.

Although I saw no fire or smoke after shutting down the engine, I started making my way through the brush away from the aircraft in case of any explosion. When I got about one-hundred feet away, the rescue helicopter appeared overhead, and I waited for the sling pick-up.

Although this was an abnormal situation to have water in the external tanks, and I received no indication from anyone that it would be such, I could have prevented the accident by making a more thorough pre-flight. The load status of the external tanks is a critical item when taking off from short runways and the pilot should firmly establish whether or not the tanks are full. Rapping the tanks is obviously not an absolute determination. I highly recommend a sight gage or some other simple, quick way of determining tank load status.

I have been TAD to Lakehurst for three months and my hurried desire at a chance to return home may have been a psychological factor in reducing the effectiveness of my pre-flight and preventing indications of full external tanks from registering in a set of circumstances where the tanks were expected to be empty.

I have 1,400 jet hours, was designated a Naval Aviator in February 1959, and

ENCLOSURE (2)

STATEMENT of PLANE CAPTAIN. (b) (6)

ADJ3, USN

USN

Tuesday, 31 August 1965, approximately 1220, I was informed that I was to send aircraft A4B, 685 out about 1400. At 1300 I checked the aircraft over on the line. I found that the center and two wing tanks had water in them. I then checked the yellow sheet. It stated that the three 300 gallon drop tanks were full. Approximately 1355, the pilot manned the plane. After light off, I went through the standard A4B signals with the pilot. The pilot gave four degrees nose up trim which checked out. The plane left the line at full flaps. As the plane taxied to the runway it went to approximate half flaps.

Credibility: Excellent

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 3750.6E"

EYEWITNESS STATEMENT of CAPTAIN HENRY W. DRUM, USN, COMMANDING OFFICER of THE U. S. NAVAL AIR STATION, LAKEHURST, NEW JERSEY CONCERNING THE AIRCRAFT ACCIDENT OCCURRING 31 AUGUST 1965

On 31 August 1965, at approximately 1916, I was on the aircraft parking apron adjacent to Hangar 307 when I heard a jet aircraft commence its take-off run on Runway 24. The aircraft, an A4 with external fuel tanks, came into my view about halfway down the runway. Slightly past the intersection of Runways 15-33 and 6-24, the pilot apparently rotated the aircraft for take-off. The aircraft in the nose high attitude did not become airborne, and shortly thereafter went off the paved runway into the over run. A small amount of dust arose in the vicinity. A second or two later the aircraft became airborne trailing light smoke and what appeared to be heavy midt of gasoline or water. The A4 attained an initial altitude of 5 to 10 feet in a nose high attitude and in a slight right turn. The aircraft did not gain altitude, disappeared from view below the trees and crashed. Within minutes an HC-2 helicopter was over the downed A4 picking up the pilot.

HENRY W. DRIM

Captain, U. S. Navy

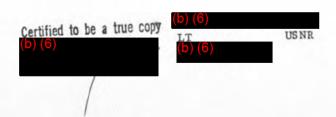

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 375%.6E".

STATEMENT of LT

CONCERNING ACCIDENT OF A4B, BUNO 142685

I was standing at a window on the second deck in the southwest corner of the hanger at West Field, NAS Lakehurst waiting to observe the takeoff of A4B, BUNO 142685. The aircraft first came into view at the access taxiway just east of the GCA Unit, on Runway 24. When the aircraft appeared it was streaming some white spray from the vicinity of both outboard droptanks. The aircraft was rotating to a takeoff attitude as it passed the GCA Unit. The rotation appeared normal in all respects until about 200 feet past the intersection of Runway 6-24 and Runway 33-15. At that point the aircraft began to rotate to a more cocked-up attitude. The aircraft left the end of Runway 24 in what I would estimate to be about a 20 to 25 degree nose high attitude. At the time the aircraft left the runway it was streaming the white spray from both drop tanks very heavily. The aircraft kicked up a very large cloud of dust as it went over the prepared overrun and was partially obscured from my sight. The aircraft left the dusty area and at that time it was in a very nose high attitude (est. over 30 degrees). The aircraft then went through another sandy spot and became airborne in an extremely nose high attitude (est. vicinity of 35 to 45 degrees). The white spray continued after the aircraft became airborne. The aircraft developed some wing rock while airborne and the nose appeared to maintain its extreme nose-high attitude as long as it was in sight. The aircraft then settled out of sight behind a line of trees, still in the very nose high attitude, and with some wing rock still apparent. After the aircraft disappeared from sight no fire was observed, but a small cloud of bluish-colored smoke appeared and then dispersed.

I was designated a Naval Aviator in December 1957 and now have 2,358 pilot hours (2,127 single engine jet) of which 813 hours are in A4-B/C aircraft. I have been an LSO since December 1959.

ENCLOSURE (5)

CONTROL TOWERS OPERATOR'S STATEMENT REGARDING THE ATTEMPTED TAKE-OFF AND SUBSEQUENT CRASH OF VJ 42685. PILOT, LT. (b) (6) NAS PATUXENT RIVER, MARYLAND.

- 1807Z VJ 42685 was cleared for take-off runway 24, winds 240 degrees at 8 knots. Pilot rogered his clearance.
- VJ 42685 had traversed approximately 3,000 feet when I observed that he appeared to be dumping fuel. At 4,000 feet it appeared that his nose gear was off the runway in an attempt to become airborne. From tower observance it appeared that his main gear remained on the runway until the aircraft left the runway proper, after which the aircraft was obscured by the dust cloud.
- The crash phone was activated at the time it became apparent that the aircraft would run off the end of the runway. All emergency equipment responded immediately.
- Department 33 (UH 2) was making an ADF approach and offered his assistance and was immediately dispatched to the scene.
- Department 33 reported the pilot was clear of the aircraft, then picked up the pilot.
- 1820Z Department 33 landed at West Field and transferred the pilot to the ambulance.

I have been in the Navy three years and have been an aircontrolman two years, three months. I have worked in the Tower at Lakehurst two years, three months, and have been a senior controller six months.

STATEMENT of LT (b) (6)

USN, (b) (6)

ASSISTANT AIRCRAFT

MAINTENANCE OFFICER, CONCERNING CRASH OF A-4B, BUNO 142685, WHICH OCCURRED

ON 31 AUGUST 1965.

The Naval Air Test Facility (Ship Installations) accepted A-4B, BUNO 142685, from the Naval Missile Center, Point Mugu on 11 June 1961. At this time this aircraft was in its second service tour with an accumulation of 349 flight hours since Navy acceptance by the Bureau of Naval Weapons Representative, El Segundo, California. The Fourth Progressive Aircraft Rework (PAR) was completed on this aircraft on 6 May 1965 by the U. S. Naval Air Station, Quonset Point, Rhode Island, Overhaul and Repair (O&R) Department. At this time the aircraft was returned to the Naval Air Test Facility, located at the U. S. Naval Air Station, Lakehurst, New Jersey, for service in launching and arrestment project evaluation. The aircraft has accumulated 55 flight hours since completion of the fourth PAR and as of the date of the crash had a total of 816 service life flight hours.

A calendar periodic inspection had not been performed on the aircraft since completion of the Fourth PAR on 6 May 1965, since only 117 days had accumulated. The major inspection interval for the A-4 aircraft is seventeen weeks, (computed to 119 days), as specified by BuWeps Instruction 4700.2A. The aircraft had been scheduled for a periodic calendar inspection to commence on 2 September 1965. The engine, Model J65 W16A, Serial Number 611931, installed in this aircraft had four previous overhauls performed, had a total of 1,234 service life hours, of which 55 hours had accumulated since the last overhaul. This engine was installed in the aircraft during the Fourth PAR, completed on 6 May 1965.

The aircraft had flown 18 catapult/arresting gear project missions from 23 August 1965 until the date of the crash. The duration of such flights is approximately .5 hours. Review of the OPNAV Form 376%-2 (Yellow Sheet) Part "B" (Discrepancy Section) revealed no aircraft or engine discrepancies resulting from the last eighteen flights.

The aircraft was configured with three (3) 300 gallon capacity external fuel tanks. In the interest of economy, water was utilized in the external tanks for ballast purposes to attain maximum aircraft gross weights for catapult launching authorized experiemental projects. Following such launchings the water is "dumped" immediately to permit arrestment recovery of normal runway landing within specified gross weight recovery/landing limitations. Dumping the water from the external wing tanks is accomplished automatically by means of an external hose adapted to the top of the tanks at approximately the longitudinal center. By this means a siphoning effect is created, dumping

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66, OPNAVINST 3750.6E".

the water automatically as air speed increases during launching. The water is dumped from the center line external tank by means of an external hose adapted to the fuel transfer flow line. The pilot must select external fuel transfer to dump the water from the center line external tank. The external fuel tank plumbing on this aircraft was completely and in all respects isolated from the aircraft fuel system.

ENCLOSURE (21)

STATEMENT OF LT (b) (6) USHR, (b) (6) PILOT OF UH-2A BUNO 150144

At 1335 local I launched from MAS Lakehurst East Field on a routine instrument training flight. LT (b) (6) (under instruction) was in the right seat and I was in the left. We departed the local pattern shortly after 1400. While IF (b) was putting on the "hood" I was climbing to 2,000" on a heading of about 060° and calling West Field tower for clearance for a practive ADF approach. West Field tower cleared me as requested and cautioned me to watch for an A-4 which was taxiin into take off position on runway 24. I say the A-4 taxiing downwind into take off position and gave the airplane to LT (b) (6) with instructions to make a right turn and proceed direct to "high station". As runway 24 came into sight, I saw a large cloud of dust and debris over the overrum area of runway 24, but the A-4 could not be seen. At this time I took control of the aircraft, started a descent toward West Field, and asked West Field tower if I could be of assistance. I was informed that the A-4 had crashed and that the crash crew was on the way. I then informed the tower that I would check the scene. I had the orange tail of the A-b in sight at about 1 mile and at about } mile the pilot was visable in the furrow the A-4 had made on touchdown. The pilot waved and gave a thumbs up as I flow over him. As I started a 360° turn I instructed LT (D) (6 to dump fuel (1600 pounds total) and as we made our approach to a hover to secure the dump valve (1200 pounds total) I entered 20 foot hover but due to leaves and twigs in the rotor wash I increased the hover to 30 feet. This did not help so I returned to 20 feet while the crewman made the pickup. We then took the pilot to the West Field line where he was transfered to an ambulance.

Weather information for this time was: OAT-74° F, Wind 190/8-14, density altitude +900° MAX Power required was 97%, there were no difficulties encountered

(b) (6)

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 56 OPNAVINST 3750.6E STATEMENT OF LT (b) (6)

CO-PILOT OF UH-2A BUNO 150144

During a simulated DNST Hop on 31 August 1965, we were practicing ADF approach to West Field Lakehurst when LT (b) (6) spotted dust clouds at the end of the runway. I raised and removed the instrument hood and we flew in the traffic pattern. We spotted the tail of the A-4 and then the pilot in an orange flight suit. We circled wide, dumping fuel and came in for the pickup. Chief (b) (6) lowered the hoist and the pilot was brought abeard. The pilot was taken from a furrowed area of a marsh in which the A-4 crashed. We then took the pilot to the ramp area of West Field.

(b) (6)

SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66 OPNAVINST 3750.6E

STATEMENT OF LTJO (b) (6) PASSENGER IN UH-2A BUNO 150144

On 31 August 1965 LT (b) (6) and LT (b) went out on a routine instrument training flight. At 1407 local time, while commencing an instrument approach to West Field, a clous of dust was noticed off the end of runway 24. Crash trucks were racing down the runway. LT (b) (6) called the tower and offered assistance and the controller dispatched us to the scene.

On arrival we saw the pilot walking away from an A-4. We circled, informing the tower that we were picking him up. We heisted him in and brought him to West Field where the A-4 pilot was transferred to a waiting ambulance.

(b) (6)

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66 OPNAVINST 3750.6E I was flying in UH-2A 150144, as an aircrewman and lookout on an instrument hop on 31 August 1965 at 1345 when LT (b) (6) called over the intercom stating that crash trucks were going out in the woods near West Field and asked me if I had a rescue sling in the back of the helo in case it was needed. We called the tower and told them we were in the area and could give assistance if needed. LT (b) (6) and I spotted the tail of the plane at the same time and I spotted the pilot in his orange flight suit walking away from the plane. I informed the pilots of the fact and we flew directly over him and made a 360 turn while damping fuel, when we came over the pilot of the downed plane for a second time the hoist boom was extended and I hooked up the sling. We were them in a hover over the pilot, so I lowered the sling. He got into the sling and I brought him up and inside the helo. Them LT (b) retracted the hoist boom and we flew over to West Field and landed. The pilot of the downed A/C, LT (b) got out and was met by a Navy doctor, and a line crewman. We then proceed back to Mat #1 and landed.

Memorandum

TO

Commander, HC-2

NAS, Lakehurst

FROM

I.T (b) (6

SUBject: Pilot Statement on Helicopter Rescue

1. After my accident in A-ZB BuNo. 142685 on 31 Aug 1965, I climbed out of the cockpit and began making my way through the brush away from the airplane. I was about 100 feet away from the airplane and about 3 minutes had passed from the time of accident when the helicopter appeared overhead. I waved at them and gave a thumbs up to indicate that I was not injured. I was in the middle of heavy brush and trees and a helicopter landing was not feasible, so a sling pickup was made.

- 2. I had removed my torso harness and helmet when the helicopter arrived overhead and at first attempted to wave the helicopter so that I could put my harness back on to take it with me. I then simply put the harness on only thru the arm openings, put my helmet on and entered the sling. I have had survival training and sling pickups before, but I entered the sling incorrectly thru the front.
 - 3. I was lifted by the sling and had no difficulty entering the helicopter.
 - 4. The helicopter pilot and erew did an outstanding job and I experi-

Very respectfully,

(b) (6) LT USN

Upon arrival at scene of crash, found A-4 upright in a swampy area 2000 ft. from the approach end of 06 runway, phlot was picked up by a helicopter.

Due to terrain, first aid fire extinguishers were taken in to the scene, checked entire platsefor fire, there was no fire present, had ejection seat secured.

Remarks: Two NATF men left for fire watch with 3 PKP fire extinguishers, 2 NATF men releaved at 2030 by 1 Marine, watch was maintained until plane was salvaged.

BRIEF STORY OF FIRE (Include all important details, attack sketch of area and operations if applicable. Use additional sheets if necessary.)

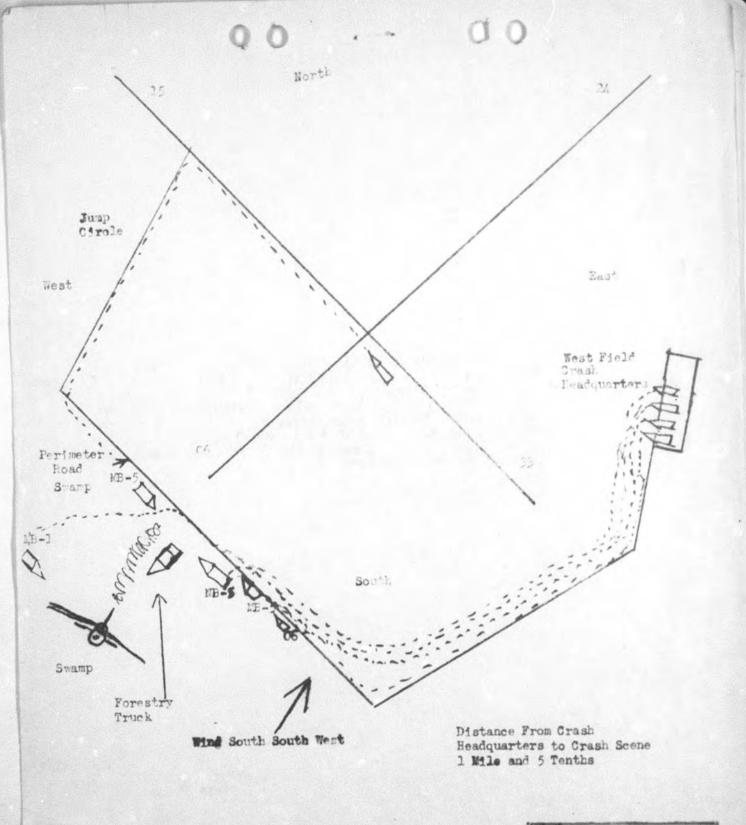

At 1410, 31 August 1965, Received call over crash phone from West Field Control Tower of an A48 aircraft crashed in woods off runnny # 24. Engine # 3 and Forestry truck dispatched to scene. Asst. Fire Chief responded in radio pickup. Upon arrival found aircraft NABB # 142685 of NATF(SI) about 300 yards south of road leading from runnay # 33 to Jet Track #1. Forestry truck proceeded toward aircraft and bogged down in mad about 500° short of aircraft , proceeded on foot with dry powder and TAB extinguishers. Used one 30 # dry powder extinguisher on hot engine, no fire visible. Pilot was removed by helicopter. Aircraft was taking off from runnay # 24.

RECOMMENDATIONS (Include action taken to prevent similar occurrences).

PILOT STATEMENT of AIRCRAFT ACCIDENT, NA4B, BUNO 142685 OCCURRING 31 AUG. 1965

At about 1330 on 31 August 1965, I went out to the West Field NATF(SI) Line to man A-4B, BuNo 142685 for a ferry flight to NAS Patuxent River. The purpose was to take the aircraft to NATC for a current weight and balance. The aircraft was being used in SATS catapult testing and an accurate C. G. and weight were desired.

As this was only a ferry hop, I did not expect the external tanks to be filled with water. No one had mentioned to me that the external tanks would be filled, and normally the tanks are only filled at the Test Facility runway (about one mile away) for test purposes. Since the long 12,000 Test Facility runway was being worked on and was not manned with crash crew or tower personnel, I planned to take off from the 5,000 foot runway at West Field under the impression that the external tanks would be empty. Take-off performance of the A-4 has been one of the primary concerns of the SATS catapult testing that I have conducted for the past three months. I have first hand knowledge from personally flight testing and observing about one-hundred A-4 heavy weight take-offs and am extremely aware of A-4 take-off performance. I am very familiar with take-off distance and airspeed requirements for gross weight and density altitude. Take-offs on the 5,000 foot runway at West Field are normal operations at Lakehurst in an A-4 with empty tanks, and I did not anticipate any problem whatsoever. I read past yellow sheets and the aircraft was in good condition with very few maintenance gripes. I did not notice any indication of water in the external tanks and overlooked it if it was there.

I had been informed that the personnel sending me out might not be completely familiar with the A-4 as the NATF(SI) Line crew was being secured early for a picnic. Therefore, on my pre-flight I did not ask any questions of the plane captain as I did not expect him to be too acquainted with that particular aircraft.

During my pre-flight, I rapped the external tanks, but I must have had such a preconceived notion that they would be empty, that the typical thud of a full tank did not register in my mind. I found no discrepancies and manned the aircraft.

Start and post start procedures were normal and the aircraft was ready for flight in every way.

Under the impression that the external tanks were empty, I called for taxi to take-off from the 5,000 foot duty runway at West Field. After completing the take-off checklist and establishing half flaps with four units nose up trim, I called for and received take-off clearance.

I added full throttle, read 100% RPM, 660°EGT, and commenced take-off roll. I did not feel anything abnormal until the last 1,500 feet when I noticed

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66 OPNAVINST 3750.6E PILOT STATEMENT of AIRCRAFT ACCIDENT, NA4B, BUNO 142685 OCCURRING 31 AUG 1965 cont.

that the nose was not coming up the way it should. I then decided to keep the nose on the runway as long as possible to gain as much speed as I could. At the end of the runway, I rotated to a flying attitude with almost 150 KIAS but the aircraft did not become airborne. I then rotated further as the aircraft went onto the dirt overrun and became airborne simultaneously with a fairly hard jolt as if I had hit something. The airspeed immediately began to drop off and I made a quick attempt to raise the landing gear to reduce drag, but it was obvious I was settling back into the trees. I was airborne an extremely short time, and I was not completely aware yet that my problem was full external tanks rather than a power failure or some other malfunction. I had no chance to observe instruments in the cockpit as the aircraft was very close to stall, and I was trying to see where I was headed. I did not eject because I was holding back pressure on the stick and had I let go, the aircraft would have pitched over nose down into the trees. I pulled the throttle back attempting to shut the engine down about the time the aircraft first hit the trees, and I braced myself with head lowered. The impact was much less than I anticipated, and I was jolted only slightly in the cockpit.

The aircraft came to a stop fairly well intact, and the cockpit area did not appear to have suffered much damage. I opened the canopy by the normal method, unstrapped, and climbed out of the cockpit. I then noticed the engine was still running at idle, so I reached back in and shut off the throttle.

Although I saw no fire or smoke after shutting down the engine, I started making my way through the brush away from the aircraft in case of any explosion. When I got about one-hundred feet away, the rescue helicopter appeared overhead, and I waited for the sling pick-up.

Although this was an abnormal situation to have water in the external tanks, and I received no indication from anyone that it would be such, I could have prevented the accident by making a more thorough pre-flight. The load status of the external tanks is a critical item when taking off from short runways and the pilot should firmly establish whether or not the tanks are full. Rapping the tanks is obviously not an absolute determination. I highly recommend a sight gage or some other simple, quick way of determining tank load status.

I have been TAD to Lakehurst for three months and my hurried desire at a chance to return home may have been a psychological factor in reducing the effectiveness of my pre-flight and preventing indications of full external tanks from registering in a set of circumstances where the tanks were expected to be empty.

I have 1,400 jet hours, was designated a Naval Aviator in February 1959, and

"SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARAGRAPH 66 OPNAVINST 3750.6E PILOT STATEMENT of AIRCRAFT ACCIDENT, NA4B, BUNO 142685 OCCURRING 31 AUG. 1965 cont.

graduated from the Naval Test Pilot School in February 1964. In the last year and a half, I have qualified and conducted flight tests in the F-4, F-8, F-104, A-1, A-3, A-4, C-1 and T-2 aircraft. I have also fammed and received pilot time in the A-5, A-6, E-2, P-2 and T-38 aircraft.

NARRATIVE OF ESCAPE/EGRESS, SURVIVAL AND RESCUE PHASES

Pilot manually turned canopy control handle, opened the canopy, and climbed out. He then walked about 100 feet away from the downed aircraft. At this point a helocopter was directly overhead. He waved to the helo and gave them a "thumbs up". The helo circled and then lowered a horse collar hoist to the pilot. Pilot climbed into hoist backwards and was brought into helo. Taken by helo to NAS Iakehurst West field and met by Station Flight Surgeon.

CONCLUSIONS AND RECOMMENDATIONS

(b) (6), (b) (5)

The error which led to his accident was the result of a psychological phenomena. Prior to manning the aircraft, LT (b) (6) mind was predjudiced to the point of believing that the external tanks were empty. All of the environmental stimuli such as the yellow sheet, percussion of the tanks during preflight, and the heavy feeling of the aircraft during taxi were subliminal for the threshold he had established. Consequently his cerebal neurons did not respond, no action was taken, and the accident developed. Immediately after the accident, the reason was apparent to him. He had a supra threshold stimulus.

For lack of a more precise description, we label this complacency. We can only try to prevent this, by preaching the fact that it can occur, and requiring an alert, questioning, and trouble free state of mind in any aviator about to man an aircraft.

The fact that LT (b) tucked his head at the moment of impact, and then suffered (b) (6)

(b) (6) may be a point worth noting. The forces of deceleration of his head were distributed along the superior-inferior axis of the cervical spine, resulting in neglegible injury.

ACCORDANCE WITH PARAGRAPH 66 OPNAVINST 3750.6E

I was standing at a window on the second deck in the southwest corner of the hangar at West Field, NAS Lakehurst waiting to observe the takeoff of A4B_BUNO 142685. The aircraft first came into view at the access taxiway just east of the GCA Unit, on Runway 24. When the aircraft appeared it was streaming some white spray from the vicinity of both outboard droptanks. The aircraft was rotating to a takeoff attitude as it passed the GCA Unit. The rotation appeared normal in all respects until about 200 feet past the intersection of Runway 6-24 and Runway 33-15. At that point the aircraft began to rotate to a more cocked-up attitude. The aircraft left the end of Runway 24 in what I would estimate to be about a 20 to 25 degree nose high attitude. At the time the aircraft left the runway it was streaming the white spray from both drop tanks very heavily. The aircraft kicked up a very large cloud of dust as it went over the prepared overrun and was partially obscured from my sight. The aircraft left the dusty area and at that time it was in a very nose high attitude (est. over 30 degrees). The aircraft then went through another sandy spot and became airborne in an extremely nose high attitude (est. vicinity of 35 to 45 degrees). The white spray continued after the aircraft became airborne. The aircraft developed some wing rock while airborne and the nose appeared to maintain its extreme nose-high attitude as long as it was in sight. The aircraft then settled out of sight behind a line of trees, still in the very nose high attitude, and with some wing rock still apparent. After the aircraft disappeared from sight no fire was observed, but a small cloud of bluish-colored smoke appeared and then dispersed.

I was designated a Naval Aviator in December 1957 and now have 2,358 pilot hours (2,127 single engine jet) of which 813 hours are in A4-B/C aircraft. I have been an LSO since December 1959.

EYEWITNESS STATEMENT of CAPTAIN HENRY W. DRUM, USN, COMMANDING OFFICER of THE U. S. NAVAL AIR STATION, LAKEHURST, NEW JERSEY CONCERNING THE AIRCRAFT ACCIDENT OCCURRING 31 AUGUST 1965

On 31 August 1965, at approximately 1/10, I was on the aircraft parking apron adjacent to Hangar 307 when I heard a jet aircraft commence its take-off run on Runway 24. The aircraft, an A4 with external fuel tanks, came into my view about halfway down the runway. Slightly past the intersection of Runways 15-33 and 6-24, the pilot apparently rotated the aircraft for take-off. The aircraft in the nose high attitude did not become airborne, and shortly thereafter went off the paved runway into the over run. A small amount of dust arose in the vicinity. A second or two later the aircraft became airborne trailing light smoke and what appeared to be heavy mixt of gasoline or water. The A4 attained an initial altitude of 5 to 10 feet in a nose high attitude and in a slight right turn. The aircraft did not gain altitude, disappeared from view below the trees and crashed. Within minutes an HC-2 helicopter was over the downed A4 picking up the pilot.

HENRY W. DRUM Captain, U. S. Navy

Tuesday, 31 August 1965, approximately 1220, I was informed that I was to send aircraft A4B, 685 out about 1400. At 1300 I checked the aircraft over on the line. I found that the center and two wing tanks had water in them. I then checked the yellow sheet. It stated that the three 300 gallon drop tanks were full. Approximately 1355, the pilot manned the plane. After light off, I went through the standard A4B signals with the pilot. The pilot gave four degrees nose up trim which checked out. The plane left the line at full flaps. As the plane taxied to the runway it went to approximate half flaps.

Credibility: Excellent

CONTROL TOWERS OPERATOR'S STATEMENT REGARDING THE ATTEMPTED TAKE-OFF AND SUBSEQUENT CRASH OF VJ 42685. PILOT, LT. (b) (6), NAS PATUXENT RIVER, MARYLAND.

- 1807Z VJ 42685 was cleared for take-off runway 24, winds 240 degrees at 8 knots. Pilot rogered his clearance.
- 18072 VJ 42685 had traversed approximately 3,000 feet when I observed that he appeared to be dumping fuel. At 4,000 feet it appeared that his nose gear was off the runway in an attempt to become airborne. From tower observance it appeared that his main gear remained on the runway until the aircraft left the runway proper, after which the aircraft was obscured by the dust cloud.
- 18082 The crash phone was activated at the time it became apparent that the aircraft would run off the end of the runway. All emergency equipment responded immediately.
- 1810Z Department 33 (UH 2) was making an ADF approach and offered his assistance and was immediately dispatched to the scene.
- 1815Z Department 33 reported the pilot was clear of the aircraft, then picked up the pilot.
- 1820Z Department 33 landed at West Field and transferred the pilot to the ambulance.

I have been in the Navy three years and have been an aircontrolman two years, three months. I have worked in the Tower at Lakehurst two years, three months, and have been a senior controller six months.
